

Actual compiled OLMoE / n-gram adaptive run; held-out records 64–127. Eight original run values, with continuous warm EWMA state.
Open dots retain both repetitions; lines are two-value medians, not confidence intervals. No reset across batches or waves.
Errors compare pre-step predictions to noisy realized outcomes, not latent truth; batch changes observation noise. Terminal requests are censored.
Rank-1 prefix errors use verified exposure; availability includes zero full-budget proposals; decision progress is the prediction actually logged online.
