

Fixed illustration: repeat 0, nominal $B = 64$, includes drain to $B = 1$; not an independent repeat or whole-run summary. State continues from the preceding measured run; all pre-step values were checked against executed updates and recorded snapshots. Pooled alpha and rank-1 prefix survival are different statistics. No-exposure/terminal outcomes remain missing, not zero. Availability is learned from complete budget-7 proposals before truncation. Panel (d) uses the actual online decision's selected cap.
