F5: actual online observer in the complete compiled matrix

Complete compiled OLMoE / n-gram matrix: 8 engines, 112 runs; fixed illustrations $\gamma = 1, 4, 7$.
Open dots show both repetitions (small horizontal display offsets); lines are medians, with no confidence intervals. EWMA state remains continuous.
MAE compares pre-step state to noisy realized step rates, not latent truth; terminal requests are censored and batch affects observation noise.
For $\gamma > 1$, pooled α is not a rank-invariant geometric constant. Native logs no decision-progress prediction; panel (c) is observed coverage only.
